

ABSTRACT

An apparatus in accordance with the invention is provided for managing various components of a motorcoach (e.g motorhome, recreational, and commercial vehicle) through a rear-view display monitor. For example, such a system may include a rear-view camera that provides a video signal comprising captured images of subject matter to the rear of a motorcoach. The video signal may be transmitted and displayed on a monitor. A coach management module in accordance with the invention may be integrated with the camera and monitor to display, simultaneously, coach data or information in the form of text and symbols, with the video signal from the rear-view camera, on the monitor.
